TO THE DATA! The Truth Shall Set your Friction Free!

Cost to Run per 10,000km - Road roading mixed conditions (based on wear rate data from main 5000km test with dry and wet contamination blocks)

(NOTE - "I.P" = wear rate results impacted by significant initial penetration issues which resulted in very high wear rates in block 1 of test. Wear rate results + cost to run calcs can be much lower if initial penetration issue negated - ie via immersive application vs manufacturer application instructions. "D.A" = lubricant was re applied at double the rate vs standard test protocol intervals due to short treatment lifespan. In the case of immersive waxes, bags of wax used was not doubled, simply the number of re-waxes)

*Note that the modelling may still be breaking down a bit for lubricants that performed very poorly in the main test, and as such the test may have stopped at end of block 2 or 3 due to already exceeding wear rate allowance. This means that the data for blocks 4, 5 and 6 are extrapolated from that point. Whilst using extrapolations based on the average for that lubricant type (wet or wax etc) - we are still extrapolating a) from a very high wear mark, and b) multiple block extrapolations compound accuracy concerns. Also, in reality it is unlikely any cyclist would be replacing chains / cassettes at the rate noted for those lubricants, what would really happen is they would use them to 1 or 2% wear - so their cost to run would not match the below, which is modelled on components being replaced at recommended wear replacement marks. As such this is a like for like comparison / benchmark of wear rate performance in to cost to help highlight the difference - it is not what in reality would be the actual cost to run for the poor performing products which in reality will just be used well past the 0.5% test wear marks.
